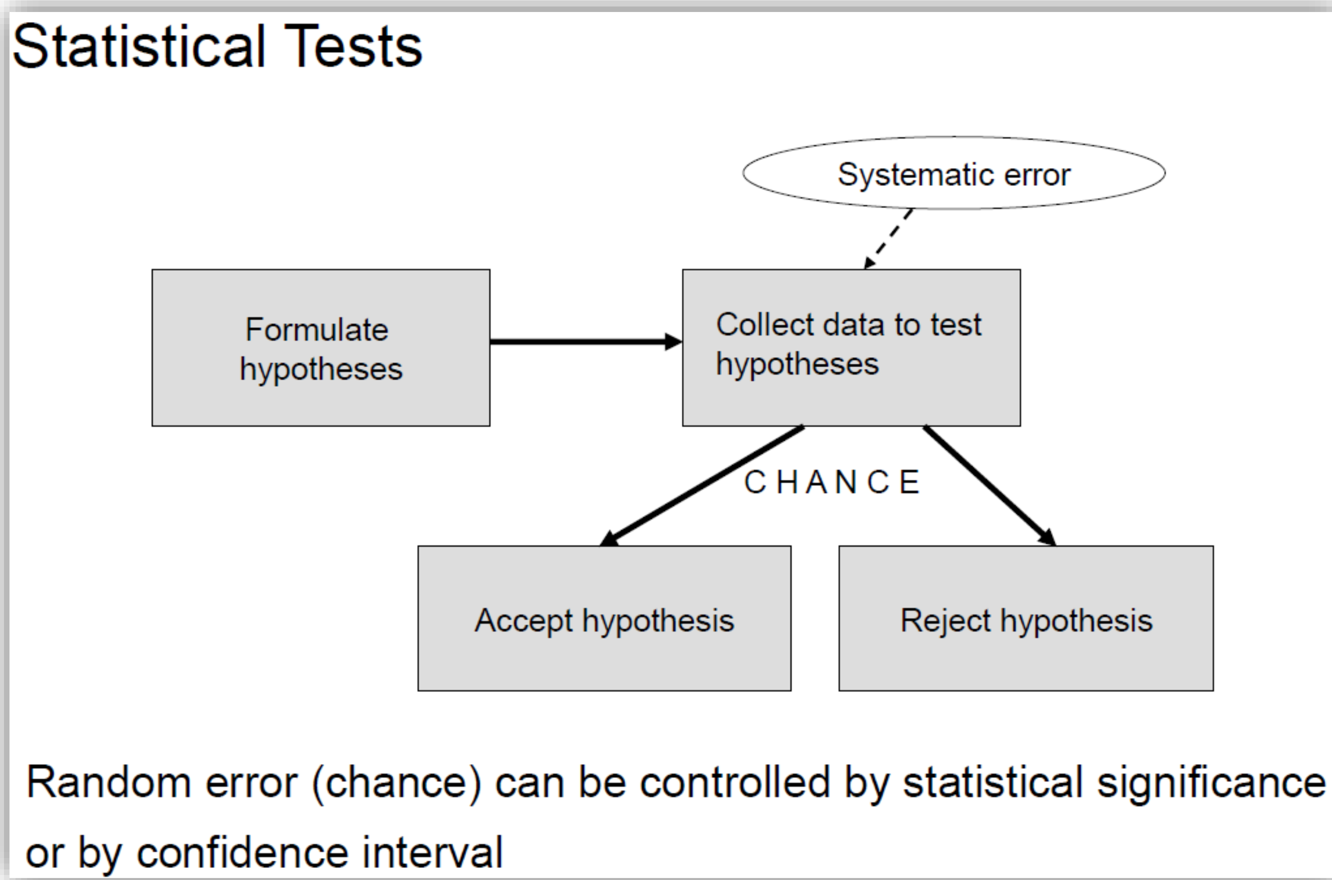
Tutorial Business Analytics

Tutorial 2: Statistics

Decision Sciences & Systems (DSS)
Department of Informatics
TU München

Tutorial 2 Business Analytics: Statistics

What we will focus on in this tutorial:



Tutorial 2 Business Analytics: Statistics

Agenda

1. Theory: How does **Hypothesis testing** work?
2. Calculation **Example**
3. Practice: **Exercises in Live Tutorial Session**

Recommendations

- Use paper and a scientific calculator for the exercises (except R exercises)
- Pay attention to the theory and the example part
- Do all exercises and homework

Tutorial 2 Business Analytics: Statistics

Statistical Testing

- We are trying to validate a claim about a statistic of a population, only based upon (a) sample(s)
- This **statistical hypothesis** is tested by observing random variables
- Common cases are
  - Sample statistic is compared against a synthetic (population) statistic
  - Two samples are compared
- A hypothesis is proposed for the **statistical relationship** between the two statistics; this is compared to a **null hypothesis**
- The comparison is denoted as **statistically significant** if the relationship between the statistics (i.e., drawing respective sample(s)) would be unlikely under the null hypothesis according to a threshold probability

Tutorial 2 Business Analytics: Statistics

“Test Manual” – Overview

1. i) 1 sample or 2 samples
   ii) If 1 sample: σ_x known or unknown
   If 2 samples: dependent or independent

2. State H_0 and H_1 (given)

3. Select and calculate the test statistic

4. Select α (given)

5. Find the critical value in the table

6. Result

Tutorial 2 Business Analytics: Statistics

“Test Manual” – 2nd Step

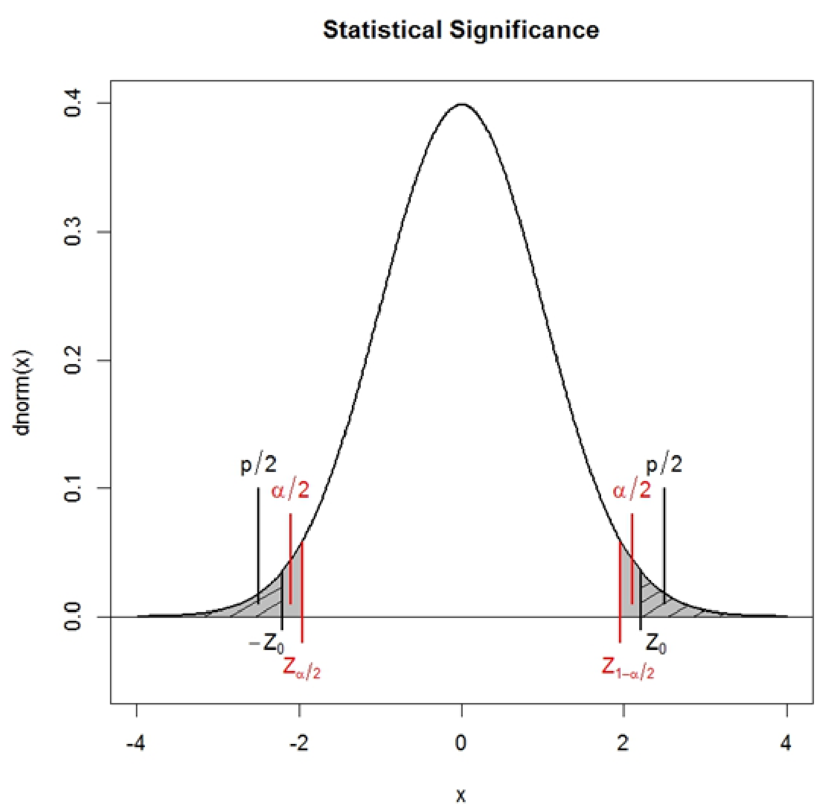
There exist three possible alternative hypotheses H_1:

Hypothesis	H_0	H_1
Two-sided	$\mu_x = \mu_0$	$\mu_x \neq \mu_0$
One-sided	$\mu_x \leq \mu_0$	$\mu_x > \mu_0$
One-sided	$\mu_x \geq \mu_0$	$\mu_x < \mu_0$

Tutorial 2 Business Analytics: Statistics

“Test Manual” – 2nd Step: Two-Sided Hypothesis Test

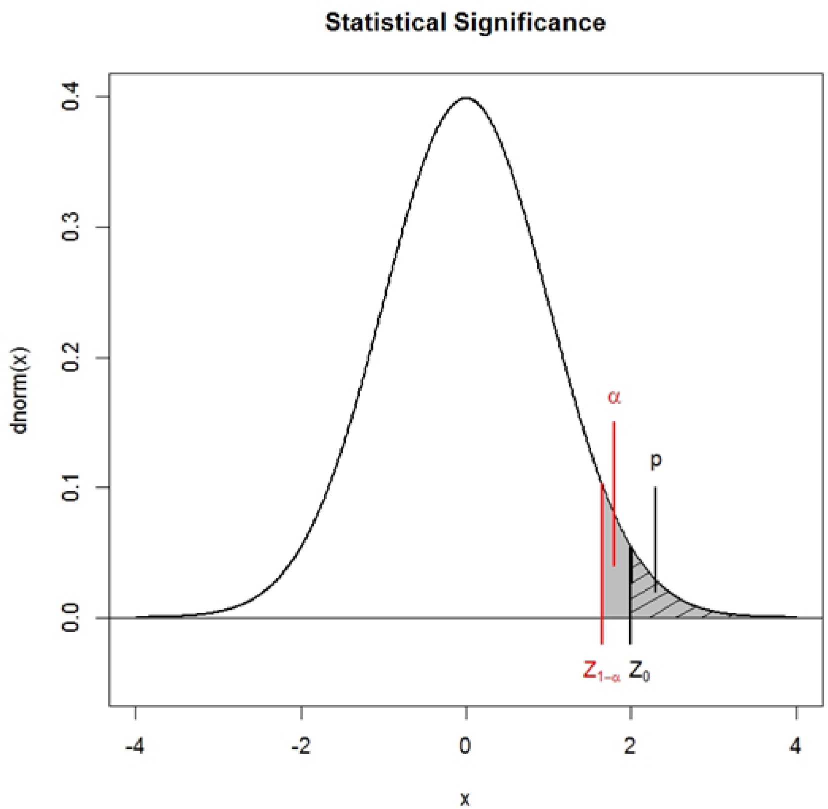
$$H_0: \mu_x = \mu_0 \qquad H_1: \mu_x \neq \mu_0$$



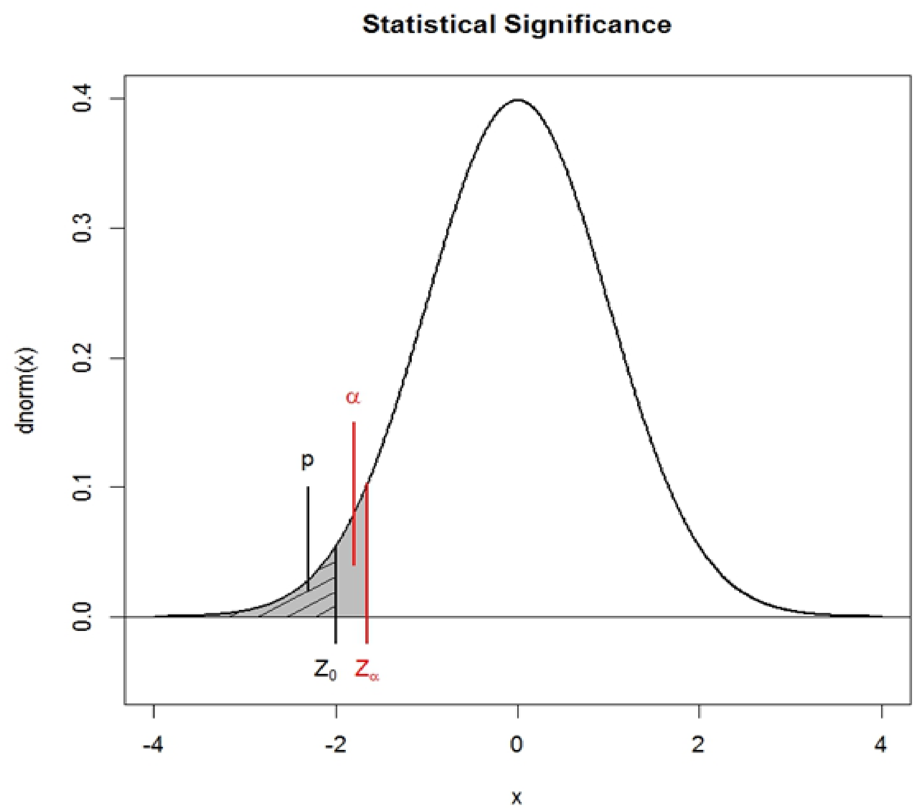
Tutorial 2 Business Analytics: Statistics

“Test Manual” – 2nd Step: One-Sided Hypothesis Test

$H_0\colon \mu_x \le \mu_0 \qquad H_1\colon \mu_x > \mu_0$



$H_0\colon \mu_x \ge \mu_0 \qquad H_1\colon \mu_x < \mu_0$



Tutorial 2 Business Analytics: Statistics

"Test Manual" – 3rd Step

When to use which test? We want to make a statement about the mean of a population, μ_x, based on a sample with size n_x and mean $\bar{x}$

1 Sample

- σ_x known → Gauss/z-test $z_0 = \frac{\bar{x}-\mu_0}{\sigma_X}\sqrt{n} \sim N(0,1)$
- σ_x unknown → t-test $t_0 = \frac{\bar{x}-\mu_0}{s_X}\sqrt{n} \sim t_{n-1}$ with $s_x^2 = \frac{1}{n-1} \cdot \sum_{i=1}^{n}(x_i - \bar{x})^2$

2 Samples

- independent → Welch-test $t_0 = \frac{\bar{x}-\bar{w}-\mu_0}{s_{\bar{x}-\bar{w}}} \sim_{\text{approx}} t_{\text{df}}$ with $s_{\bar{x}-\bar{w}}^2 = \frac{s_x^2}{n_x} + \frac{s_w^2}{n_w}$ and

  $s_x^2 = \frac{1}{n-1} \cdot \sum_{i=1}^{n}(x_i - \bar{x})^2$ $\left(\text{df} = \frac{\left(s_{\bar{x}-\bar{w}}^2\right)^2}{\frac{s_x^4}{n_x^2(n_x-1)} + \frac{s_W^4}{n_W^2(n_W-1)}}\right.$ rounded to nearest integer number)
- dependent → Paired t-test $t_0 = \frac{\bar{d}-\mu_0}{s_d}\sqrt{n} \sim t_{n-1}$ with $s_d^2 = \frac{1}{n-1} \cdot \sum_{i=1}^{n}(d_i - \bar{d})^2$ and

  $\bar{d} = \frac{1}{n}\sum_{i=1}^{n} d_i = \bar{x} - \bar{w}, \quad d_i = x_i - w_i, \quad \mu_D = \mu_X - \mu_W$

Tutorial 2 Business Analytics: Statistics

“Test Manual” – 5th Step

How to find the critical value in the table? For

- Gauss/z-Test → use normal distribution
- t-Test, Welch-Test and Paired t-Test → use t-distribution

H_1	**t^c range**	**t^c value**
$\mu_x \neq \mu_0$	can be any, $\mathbb{R}$	$\left\lvert t^c_{1-\frac{\alpha}{2};\,\mathrm{df}} \right\rvert = \left\lvert t^c_{\frac{\alpha}{2};\,\mathrm{df}} \right\rvert$
$\mu_x > \mu_0$	must be positive, $\mathbb{R}_{>0}$	$t^c_{1-\alpha;\,\mathrm{df}}$
$\mu_x < \mu_0$	must be negative, $\mathbb{R}_{<0}$	$t^c_{\alpha;\,\mathrm{df}}$

Tutorial 2 Business Analytics

Normal Distribution (z-table)

- If X is a normally distribution random variable with mean μ and standard deviation σ,

$$Z = \frac{X - \mu}{\sigma}$$

  is **standard normally distributed**
- The table contains the *probabilities* that a statistic is less than z, i.e., between negative infinity and z
- The values are calculated using the cumulative distribution function Φ
- Examples:
  - $\boxed{\Phi(0.72) = 0.76424}$
  - $\boxed{\Phi(-1.48) = 1 - \Phi(1.48) = 0.06944}$
  - If quantile $z_{0.9}$ is needed:
    $\Phi(z_{0.9}) = 0.9 \quad \Rightarrow \quad \boxed{z_{0.9} \approx 1.28}$

Tutorial 2 Business Analytics

t-Distribution (t-table)

- A random variable with t-distribution arises, e.g., when estimating the mean of a normally distributed population in situations with a small sample size and unknown population standard deviation
- The numbers in the body of the table, $t^{c}_{1-\alpha;\,\mathrm{df}}$, are the critical values needed for the t-test
  - df: degrees of freedom
  - α: significance level

cum. prob	$t_{.50}$	$t_{.75}$	$t_{.80}$	$t_{.85}$	$t_{.90}$	$t_{.95}$	$t_{.975}$	$t_{.99}$	$t_{.995}$	$t_{.999}$	$t_{.9995}$

"Test Manual" – 6th Step

Reject H_0:

H_1	p-value criterion	test statistic criterion
$\mu_x \neq \mu_0$	$p < \alpha$	$\lvert t_0 \rvert > \left\lvert t^c_{1-\frac{\alpha}{2};\,\mathrm{df}} \right\rvert$
$\mu_x > \mu_0$	$p < \alpha$	$t_0 > t^c_{1-\alpha;\,\mathrm{df}}$
$\mu_x < \mu_0$	$p < \alpha$	$t_0 < t^c_{\alpha;\,\mathrm{df}}$

Tutorial 2 Business Analytics: Statistics

Example: Learning Method Comparison

In order to compare two learning methods, results have been measured for a group of students. Test if the students got better (higher) results using method 2. Assume the difference follows a normal distribution, (significance level of 5%, i.e., $\alpha = 0.05$).

student	1	2	3	4	5
method 1 (x)	8	6	8	8	4
method 2 (w)	10	9	7	12	7

1.) i) 2 samples ii) dependent

2.) $H_0\colon\ \mu_D = \mu_X - \mu_W \geq \mu_0 = 0$ $H_1\colon\ \mu_D = \mu_X - \mu_W < \mu_0 = 0$

3.) → Paired t-Test: $t_0 = \frac{\bar{d}-\mu_0}{s_d}\sqrt{n} \sim t_{n-1}$ with unbiased sample variance $s_d^2 = \frac{1}{n-1}\sum_{i=1}^{n}(d_i - \bar{d})^2$

sample means: $\bar{x} = 6.8$, $\bar{w} = 9.0$, difference $\bar{d} = -2.2$,

$s_d^2 = 3.7, \quad s_d = 1.9235 \quad \Rightarrow \quad t_0 = -2.5574$

4.) $\alpha = 0.05$

5.) $\rightarrow\ t^c_{\alpha;n-1} = -t^c_{1-\alpha;n-1}\ (\text{sym.}) \ \Rightarrow\ t^c_{0.05;4} = -t^c_{0.95;4} \overset{\text{table}}{=} -2.132$

6.) $t_0 = -2.557 < -2.132 = t^c_{0.05;4} \ \Rightarrow$ Reject H_0: Learning method 2 is significantly better.

Tutorial 2 Business Analytics: Statistics

Example: Learning Method Comparison – step 3 details

In order to compare two learning methods, results have been measured for a group of students. Test if the students got better (higher) results using method 2. Assume the difference follows a normal distribution, (significance level of 5%, i.e., $\alpha = 0.05$).

student	1	2	3	4	5
method 1 (x)	8	6	8	8	4
method 2 (w)	10	9	7	12	7

3.)

sample means: $\bar{x} = \frac{1}{5}(8+6+8+8+4) = 6.8$, $\bar{w} = \frac{1}{5}(10+9+8+12+7) = 9.0$

difference: $\bar{d} = \frac{1}{n}\sum_{i=1}^{n} d_i = \bar{x} - \bar{w} = -2.2$

sample variance: $s_d^2 = \frac{1}{n-1}\sum_{i=1}^{n}(d_i - \bar{d})^2$, $d_i = x_i - w_i$,

$$s_d^2 = \frac{1}{4}\left((8-10+2.2)^2+(6-9+2.2)^2+(8-7+2.2)^2+(8-12+2.2)^2+(4-7+2.2)^2\right) = 3.7$$

$$s_d = 1.9235$$

Tutorial 2 Business Analytics: Statistics

Confidence Intervals

Find confidence intervals for μ_x, which—under H_0—contain the true value μ_x with a probability of at least $1-\alpha$ (confidence level). We differentiate two cases:

- σ_x known:

confidence interval: $$\boxed{[I_u(x),\ I_o(x)] = \left[\bar{x} - z^c_{1-\frac{\alpha}{2}} \frac{\sigma_x}{\sqrt{n}},\ \bar{x} + z^c_{1-\alpha/2} \frac{\sigma_x}{\sqrt{n}}\right]}$$

- σ_x unknown, use s_x as estimate instead:

confidence interval: $$\boxed{[I_u(x),\ I_o(x)] = \left[\bar{x} - t^c_{1-\frac{\alpha}{2};\, n-1} \frac{s_x}{\sqrt{n}},\ \bar{x} + t^c_{1-\frac{\alpha}{2};\, n-1} \frac{s_x}{\sqrt{n}}\right]}$$

- Values of μ_0 within the confidence interval cannot be rejected regarding a significance level of α

  $\rightarrow$ Reject H_0 if μ_0 is not in the confidence interval

Tutorial 2 Business Analytics: Statistics

Exercise 2.1

The consumption per person is measured in index values, where a high index value represents a high consumption. The following table embodies index values for 10 individuals before and after a tax increase.

Individual number, i	Index value		Difference, $d = a - b$
	previous to tax increase, a	after tax increase, b	
1	27	40	-13
2	31	36	-5
3	23	43	-20
4	35	34	1
5	26	25	1
6	27	41	-14
7	26	32	-6
8	18	29	-11
9	22	21	1
10	21	36	-15

a) Determine if there is a significant difference in consumption prior to the tax increase and after, utilizing a hypothesis test (significance level $\alpha = 0.05$). The difference is assumed to be normally distributed.

b) Check your result by applying `t.test()` in R.

Tutorial 2 Business Analytics: Statistics

Exercise 2.1

1.) i) 2 samples ii) dependent

2.) $\mu_D = \mu_{\text{before}} - \mu_{\text{after}}$

H_0: $\mu_{\text{before}} = \mu_{\text{after}} \Leftrightarrow H_0$: $\mu_D = \mu_0 = 0$ H_1: $\mu_{\text{before}} \neq \mu_{\text{after}} \Leftrightarrow H_1$: $\mu_D \neq \mu_0 = 0$

3.) → Paired t-Test: $t_0 = \frac{\bar{d}-\mu_0}{s_d}\sqrt{n} \sim t_{n-1}$ and $s_d^2 = \frac{1}{n-1} \cdot \sum_{i=1}^{n}(d_i - \bar{d})^2$

average Difference, $\bar{d}$	standard deviation of differences, s_d
-8.1	7.5931

$$t_0 = \frac{\bar{d}-\mu_0}{s_d}\sqrt{n} = \frac{-8.1-0}{7.5931}\sqrt{10} = -3.3734$$

4.) $\alpha = 0.05$

5.) $\rightarrow t^c_{1-\frac{\alpha}{2};\, n-1} = t^c_{0.975;\, 9} = 2.262$

6.) $\boxed{|t_0| = 3.3734 > 2.262 = t^c_{0.975;\, 9}}$

Reject H_0: difference is significant at $\alpha = 0.05$ (tax has an effect on consumption)

Tutorial 2 Business Analytics: Statistics

Exercise 2.1

b) Check your result by applying `t.test()` in R.

```
#use paired=T
a <- c(27,31,23,35,26,27,26,18,22,21)
b <- c(40,36,43,34,25,41,32,29,21,36)
t.test(a,b,alternative = "two.sided", paired=T)

#<=> test if difference is significantly different from zero
d <- c(-13,-5,-20,1,1,-14,-6,-11,1,-15)
t.test(d)
```

Output:

```
        Paired t-test

data:  before and after
t = -3.3734, df = 9, p-value = 0.008213
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
 -13.531795  -2.668205
sample estimates:
mean of the differences
                   -8.1
```

H_0 is rejected!

Tutorial 2 Business Analytics: Statistics

Exercise 2.2

According to the information supplied by the manufacturer of a certain type of car, its gas consumption in city traffic is approximately normally distributed with expected value $\mu = 9.5\ell/100\text{km}$. The standard deviation $\sigma = 2.5\ell/100\text{km}$ is commonly known (to the general public and the manufacturer). In order to review the manufacturer‘s prediction, a consumer organization has performed a test on 25 cars which yielded the following result:

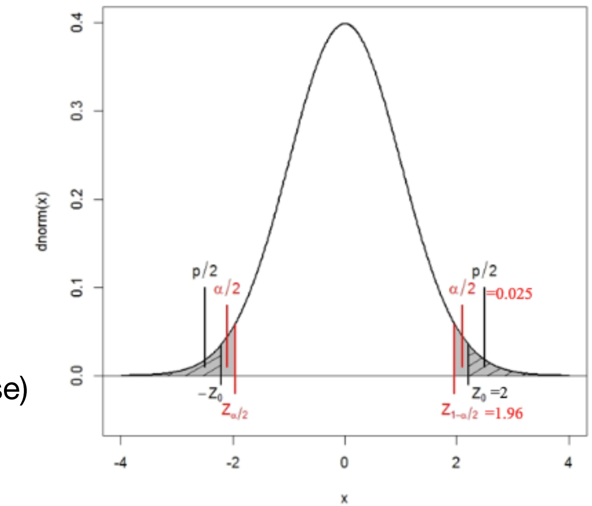
Average gas consumption: $\bar{x} = 10.5\ell/100\text{km}$

Check the manufacturer‘s statement with a suitable test at significance level of $\alpha = 0.05$ and a second time with $\alpha = 0.01$.

Tutorial 2 Business Analytics: Statistics

Exercise 2.2 (using test statistics criterion)

Summary of a) $\alpha = 0.05$



1.) i) One sample ii) σ_x known

2.) $H_0\colon \mu_x = \mu_0 = 9.5$ (manufacturer‘s information correct)

$H_1\colon \mu_x \neq \mu_0 = 9.5$ (manufacturer’s information not correct)

3.) → Gauss Test:

$$z_0 = \frac{\bar{x}-\mu_0}{\sigma_x}\sqrt{n}$$

$$= \frac{10.5-9.5}{2.5}\sqrt{25} \quad \text{(inserting values of exercise)}$$

$$= 2$$

4.) Significance level: a) $\alpha = 0.05$ b) $\alpha = 0.01$

5.) Since it is two-sided test we use $\alpha/2$ to find the critical value :

a) $1-\alpha/2 = 1-0.025 = 0.975$; $z^c = z_{0.975} \approx 1.96$

b) $1-\alpha/2 = 1-0.005 = 0.995$; $z^c = z_{0.995} \approx 2.58$

6.) a) $z_0 = 2 > 1.96 \approx z^c$ → H_0 is rejected

b) $z_0 = 2 < 2.58 \approx z^c$ → H_0 is not rejected

Tutorial 2 Business Analytics: Statistics

Exercise 2.2 (using p-value criterion)

1.) i) One sample ii) σ_x known

2.) H_0: $\mu_x = \mu_0 = 9.5$ (manufacturer‘s information correct)

H_1: $\mu_x \neq \mu_0 = 9.5$ (manufacturer’s information not correct)

3.) → Gauss Test:

$$z_0 = \frac{\bar{x}-\mu_0}{\sigma_x}\sqrt{n}$$

$$= \frac{10.5-9.5}{2.5}\sqrt{25} \quad \text{(inserting values of exercise)}$$

$$= 2$$

4.) Significance level: a) $\alpha = 0.05$ b) $\alpha = 0.01$

5.) Calculating p value corresponding to the test statistic:

$$\frac{p}{2} = 1 - \phi(z_0) \approx 1 - 0.97725 = 0.02275 \approx 0.023$$

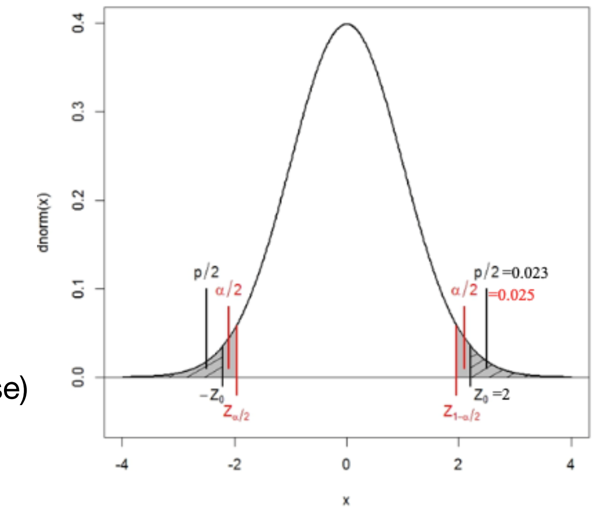
(Note: since it is two sided test what we get from the test statistic is p/2)

6.) We compare p/2 with α/2:

a) $p/2 \approx 0.023 < 0.025 = \alpha/2$ $\Rightarrow$ $\mathrm{p} < \alpha$ $\Rightarrow H_0$ is rejected

b) $p/2 \approx 0.023 > 0.005 = \alpha/2$ $\Rightarrow$ $\mathrm{p} > \alpha$ $\Rightarrow H_0$ is not rejected

Summary of a) $\alpha = 0.05$



Tutorial 2 Business Analytics: Statistics

Exercise 2.3

During a recent study project, a friend of yours asked 8 men and 10 women how many hours per day they wear a mask during the ongoing COVID-19 pandemic. The following table shows their answers. Afterwards he/she set the hypothesis to "On average, women wear their mask longer per day".

Individual no. i	Hours per day	Gender
1	4	**female**
2	2	**female**
3	3	**female**
4	5	**female**
5	7	**female**
6	2	**female**
7	7	**female**
8	3	**female**
9	5	**female**
10	2	**female**
11	2	**male**
12	1	**male**
13	5	**male**
14	3	**male**
15	1	**male**
16	3	**male**
17	2	**male**
18	3	**male**

a) Test the hypothesis “by hand” with significance level $\alpha = 0.05$ and 16 degrees of freedom.

b) Find out how to solve this exercise using R.

Tutorial 2 Business Analytics: Statistics

Exercise 2.3 a)

1.) i) Two samples ii) independent

2.) $H_0\!: \mu_D = \mu_f - \mu_m \leq \mu_0 = 0$ $H_1\!: \mu_D = \mu_f - \mu_m > \mu_0 = 0$

3.) → Welch Test:

$$t_0 = \frac{\bar{x}_f - \bar{x}_m - \mu_0}{s_{\bar{f}-\bar{m}}} \text{ and } s^2_{\bar{x}-\bar{w}} = \frac{s_f^2}{n_f} + \frac{s_m^2}{n_m}$$

$$\bar{x}_f = \frac{4+2+3+5+7+2+7+3+5+2}{10} = 4 \text{ and } \bar{x}_m = \frac{2+1+5+3+1+3+2+3}{8} = 2.5$$

$$s_f^2 = \frac{(4-4)^2+(2-4)^2+(3-4)^2+(5-4)^2+(7-4)^2+(2-4)^2+(7-4)^2+(3-4)^2+(5-4)^2+(2-4)^2}{10-1}$$

$$= \frac{0^2+(-2)^2+(-1)^2+1^2+3^2+(-2)^2+3^2+(-1)^2+1^2+(-2)^2}{9} = 3.778$$

$$s_m^2 = \frac{(-0.5)^2+(-1.5)^2+2.5^2+0.5^2+(-1.5)^2+0.5^2+(-0.5)^2+0.5^2}{7} = 1.714$$

$$s^2_{\bar{f}-\bar{m}} = \frac{3.778}{10} + \frac{1.714}{8} = 0.592 \quad \rightarrow \quad s_{\bar{f}-\bar{m}} = 0.769$$

$$t_0 = \frac{1.5}{0.769} = 1.949$$

df = 16 was given in the exercise, but can also be calculated by hand

$$df = \frac{\left(s^2_{\bar{f}-\bar{m}}\right)^2}{\frac{s_f^4}{n_f^2(n_f-1)} + \frac{s_m^4}{n_m^2(n_m-1)}}$$

4.) Significance level: $\alpha = 0.05$

5.) $t^c_{0.95;16} = 1.746$

6.) $t_0 = 1.949 > 1.746 = t^c$ → H_0 can be rejected.

→ Regarding a significance level of it can be concluded that on average, women wear their mask longer.

Tutorial 2 Business Analytics: Statistics

Exercise 2.3 b)

The same result can be achieved by using R as follows:

```
> female <- c(4,2,3,5,7,2,7,3,5,2)
> male <- c(2,1,5,3,1,3,2,3)
> t.test(female, male, alternative="greater", paired=F)
```

Output:

```
            Welch Two Sample t-test
data:  female and male
t = 1.9494, df = 15.637, p-value = 0.03471
alternative hypothesis: true difference in means is greater than 0
95 percent confidence interval:
 0.1547037       Inf
```
